Cancer of the prostate is now recognized as one of the principal medical problems facing the male population. The disease accounts for 9% of all cancer deaths among men. As men live longer, an increase in both incidence and mortality of prostate cancer can be observed. Apart from age, the primary risk factor is hereditary and clinical data seems to support that exogenous factors may have an important impact on the risk of developing CaP (race, diet containing a high content of animal fat, exposure to heavy metals, etc.). Thus the same stage of prostate cancer may need different treatment strategies, pending on the patient's life expectancy. This, and many other issues regarding the disease, is the subject of the EAU guidelines on prostate cancer. Prostate Cancer. Staging system.
