Human Physiology. by Wikibooks contributors. Human physiology is the study of the functioning of the normal body, and is responsible for describing how various systems of the human body work. Explanations often begin at a macroscopic level and proceed to a molecular level. In 1926, Fritz Kahn portrayed the body as a complex chemical plant, as seen in the painting on the right. Human Physiology is an international peer reviewed journal aimed at promoting the integration of theory, methods, and research in human physiology. The journal publishes original studies on brain function and its disturbances, including neural mechanisms subserving perception, learning, memory, emotion, and language. Human Physiology provides a forum for many areas of physiology, such as respiration, circulation, the blood system, motor functions, and digestion, as well as sport and occupational physiology. Human physiology is the science of the mechanical, physical, and biochemical functions of normal humans or human tissues or organs. The principal level of focus of physiology is at the level of organs and systems. They play a vital role in providing immunity, producing Vitamin K, relieving lactose intolerance and shortening diarrhea. Besides; it promises the management of Atopy and other incurable conditions. DNA damage response is essential to human physiology. A broad spectrum of pathologies are displayed by individuals carrying monoallelic or biallelic loss-of-function mutations in DNA damage repair genes.

Human Physiology is the study of normal biological function from atoms to molecules, to cells to tissues, and to organs and organ systems. It is the integration of each of these elements that allows for the human body to function as a whole to accomplish particular tasks. In this course, we will focus on how the human body works through the activities of interconnected organ systems.
